

## LAB 5> Computer Network Design using HUB in GNS3

210905272

1. Design network configuration shown in Figure 5.29 for all parts. Connect all four VMs to a single Ethernet segment via a single hub as shown in Figure 5.29. Configure the IP addresses for the PCs as shown in Table 6.1.

Figure 5.29: Network Design

VMS	IP Addresses of Ethernet Interface eth0
PC1	10.0.1.11 / 24
PC2	10.0.1.12 / 24
PC3	10.0.1.13 / 24
PC4	10.0.1.14 / 24

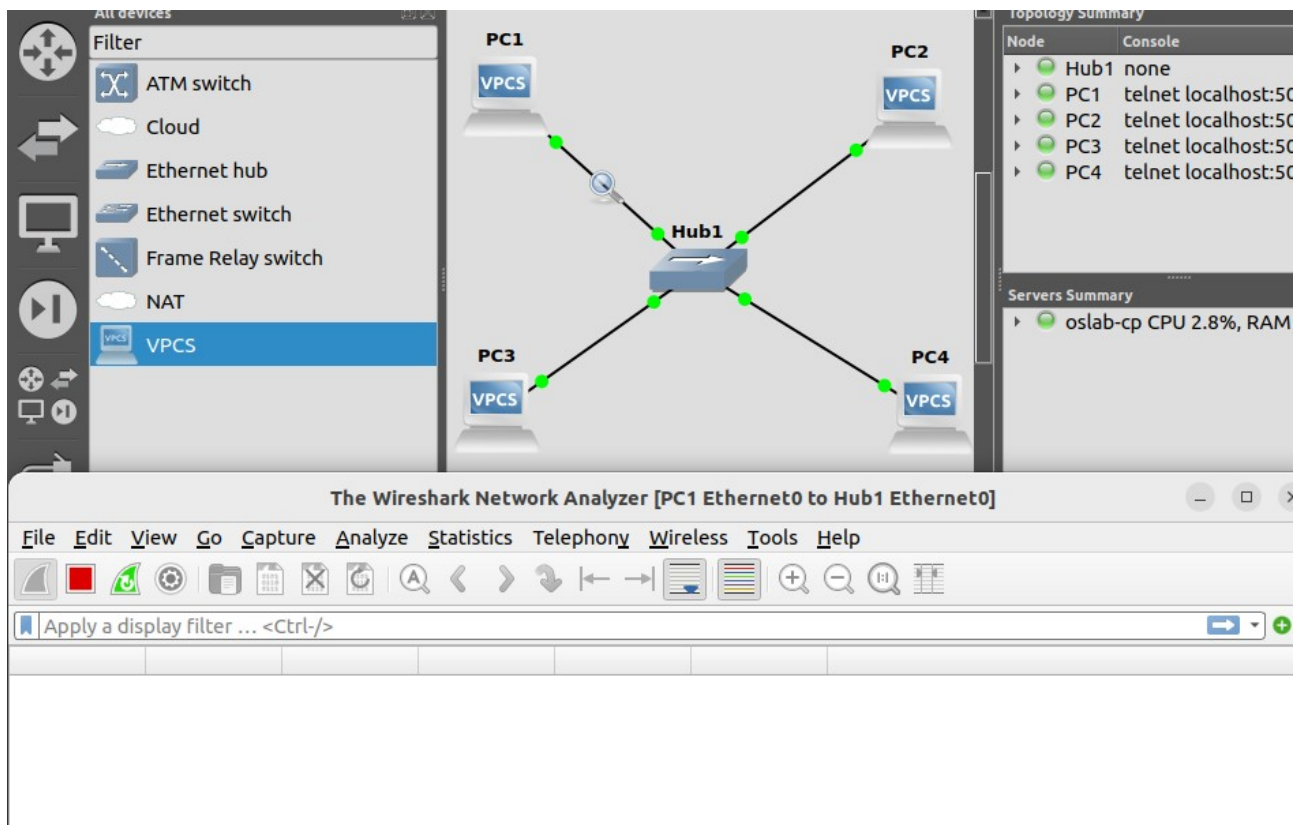

**a. On PC1, view the ARP cache with show arp**

The Address Resolution Protocol cache has no entries since no broadcast message has been sent out.

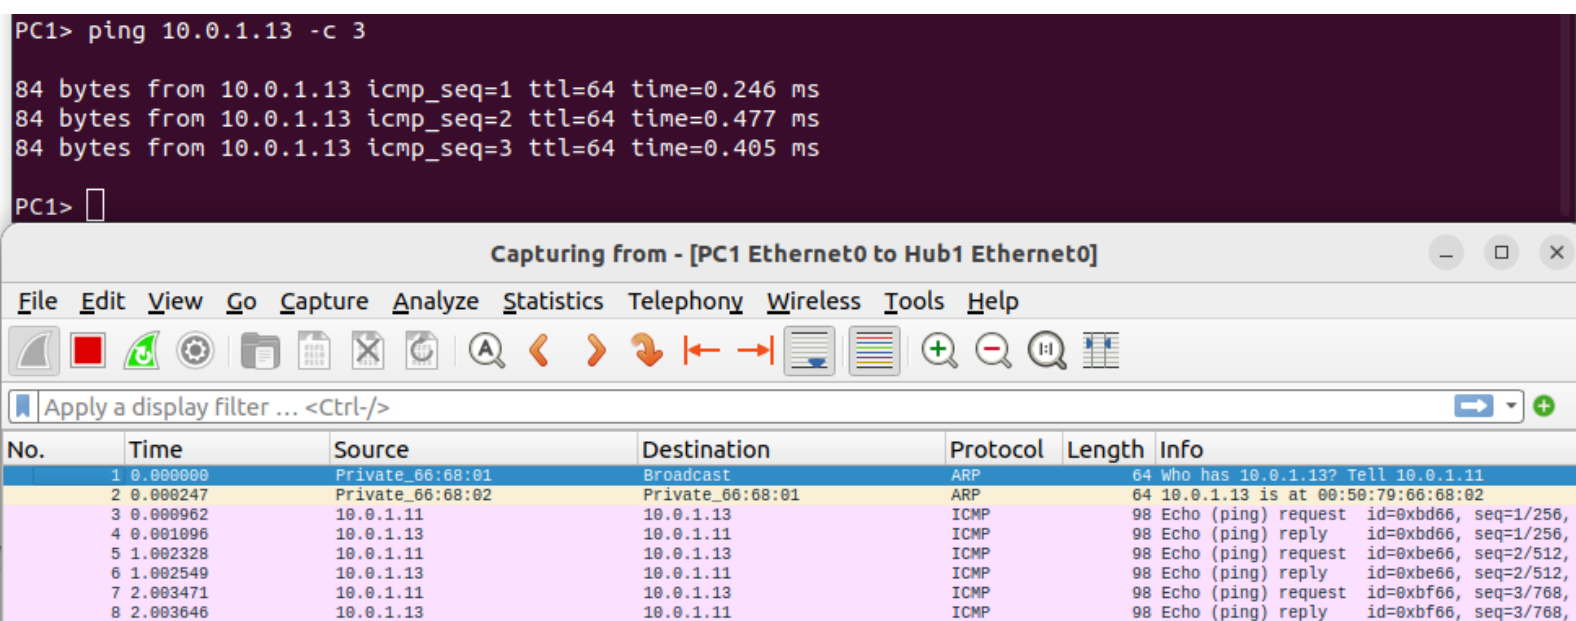

```
PC1> show arp
arp table is empty
```

**b. Start Wireshark on PC1-Hub1 link with a capture filter set to the IP address of PC2.**

Initially empty

c. Issue a ping command from PC1 to PC2

ping 10.0.1.13 -c 3  
sends 3 packets from pc1(10.0.1.11) to pc3(10.0.1.13)

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	Private_66:68:01	Broadcast	ARP	64	Who has 10.0.1.13? Tell 10.0.1.11

d. View the ARP cache again with the command `arp -a`.

```
PC1> show arp

00:50:79:66:68:02  10.0.1.13 expires in 88 seconds
```

e. Save the results of Wireshark.

2. To observe the effects of having more than one host with the same (duplicate) IP address in a network.

```
PC1> ip 10.0.1.11/24
Checking for duplicate address...
PC1 : 10.0.1.11 255.255.255.0

PC1> █
```

```
PC4> ip 10.0.1.11/24
Checking for duplicate address...
10.0.1.11 is being used by MAC 00:50:79:66:68:01
Address not changed

PC4>
```

Two PC on the same network cannot have the same address. Addresses are unique.

a. Delete all entries in the ARP cache on all PCs.

reset ARP

ARP entries reset themselves in 2 minutes

b. Run Wireshark on PC3-Hub1 link and capture the network traffic to and from the duplicate IP

address 10.0.1.11.

c. From PC3, issue a ping command to the duplicate IP address, 10.0.1.11, by typing

PC3% ping 10.0.1.11 -c 5

d. Stop Wireshark, save all ARP packets and screenshot the ARP cache of PC3 using arp -a command: PC3% arp -a

e. When you are done with the exercise, reset the IP address of PC4 to its original value as given in Table 6.1.

### 3. To test the effects of changing the netmask of a network configuration.

a. Design the configuration as Exercise 1 and replace the hub with a switch, two hosts (PC2 and PC4) have been assigned different network prefixes.

Setup the interfaces of the hosts as follows:

#### VPCS IP Address of eth0 Network Mask

PC1 10.0.1.100 / 24 255.255.255.0

PC2 10.0.1.101 / 28 255.255.255.240

PC3 10.0.1.120 / 24 255.255.255.0

PC4 10.0.1.121 / 28 255.255.255.240

```

PC1> ip 10.0.1.100/24 255.255.255.0
Checking for duplicate address...
PC1 : 10.0.1.100 255.255.255.0

PC2> ip 10.0.1.101/28 255.255.255.240
Checking for duplicate address...
PC2 : 10.0.1.101 255.255.255.240

PC3> ip 10.0.1.120/24 255.255.255.0
Checking for duplicate address...
PC3 : 10.0.1.120 255.255.255.0

PC4> ip 10.0.1.121/28 255.255.255.240
Checking for duplicate address...
PC4 : 10.0.1.121 255.255.255.240

```

**b. Run Wireshark on PC1-Hub1 link and capture the packets for the following scenarios**

**i. From PC1 ping PC3.**

ping 10.0.1.120/24 -c 1  
84 bytes sent

PC1> ping 10.0.1.120/24 -c 3

```

84 bytes from 10.0.1.120 icmp_seq=1 ttl=64 time=0.378 ms
84 bytes from 10.0.1.120 icmp_seq=2 ttl=64 time=0.642 ms
84 bytes from 10.0.1.120 icmp_seq=3 ttl=64 time=0.350 ms

```

PC1>

Time	Source	Destination	Protocol	Length	Info
1.0.000000	10.0.1.100	10.0.1.120	ICMP	98	Echo (ping) request id=0xf470, seq=1/256
2.0.000220	10.0.1.120	10.0.1.100	ICMP	98	Echo (ping) reply id=0xf470, seq=1/256
3.12.000020	10.0.1.100	10.0.1.120	ICMP	98	Echo (ping) request id=0x0071, seq=1/256

**ii. From PC1 ping PC2.**

ping 10.0.1.101/28 -c 3

SPECIAL CASE: should not ping since network masks are different. In binary the masked bits are the same. First 4 bits match in net Id of pc2 and host id of pc1.

```

PC1> ping 10.0.1.101/28 -c 3

84 bytes from 10.0.1.101 icmp_seq=1 ttl=64 time=0.393 ms
84 bytes from 10.0.1.101 icmp_seq=2 ttl=64 time=0.371 ms
84 bytes from 10.0.1.101 icmp_seq=3 ttl=64 time=0.362 ms

**iii. From PC1 ping PC4.** PC1 cannot reach PC2 since they have different network prefixes.

ping 10.0.1.121/28 -c 3

Different network prefixes. Different subnets mask value

```
PC1> ping 10.0.1.121/28 -c 3

iv. From PC4 ping PC1.

```
PC4> ping 10.0.1.100/24 -c 3

host (255.255.255.240) not reachable

PC4>
```

v. From PC2 ping PC4.

Ping packets sent from pc2 to pc4 but cannot be captured using current setup of wireshark since it is capturing for pc1 to switch and it is not involved

vi. From PC2 ping PC3.

Ping packets sent from pc2 to pc3 but cannot be captured using current setup of wireshark since it is capturing for pc1 to switch and it is not involved

c. Save the Wireshark output to a text file (using the “Packet Summary” option from “Print”) , and save the output of the ping commands. Note that not all of the above scenarios are successful. Save all the output including any error messages.

d. When you are done with the exercise, reset the interfaces to their original values as given Table 6.1. (Note that /24 corresponds to network mask 255.255.255.0. and /28 to network mask 255.255.255.240).
